

# SESSION 1: DESIGNING A TELESCOPE

# ACTIVITY 2: MIRROR SELECTION

Circular Mirrors:	Diameter	1 m	2 m	3 m	4 m
<p>Gaps between mirrors = light lost</p> <p>Gaps within this mirror set-up reduce the total collection area by 10%</p> <p>To calculate your effective mirror diameter: = diameter of single mirrors combined x 0.9</p> 	Mirror				
	Cost	£2 million	£4 million	£8 million	£16 million
	Weight	500 kg	1000 kg	1500 kg	2000 kg
Hexagonal Mirrors:	Diameter	1 m	2 m	3 m	4 m
<p>To calculate your effective mirror diameter: = diameter of single mirrors combined</p>  <p>Note: sizes of mirrors can be combined</p>	Mirror				
	Cost	£3 million	£6 million	£12 million	£24 million
	Weight	415 kg	830 kg	1240 kg	1654 kg

### You must consider...

- ☆ How the different shaped mirrors fit together and how much light is lost through any gaps.
- ☆ The overall weight of their mirror – the lighter the better – this will affect which materials they can use for the structure.
- ☆ How easily the mirror will be able to be transported to site.
- ☆ The total diameter of the mirror – the larger the mirror the fainter the objects they will be able to see – this means that they will be able to look for objects at greater distances.
- ☆ The price of the mirror.
- ☆ How easily the mirror can be assembled on site.
